dev-loop-ultralight

One reviewer, one round, no verification phase — a nine-concern sweep in a single pass. Review cost ≈ 0.1× a full run. Implementation is NOT downgraded.

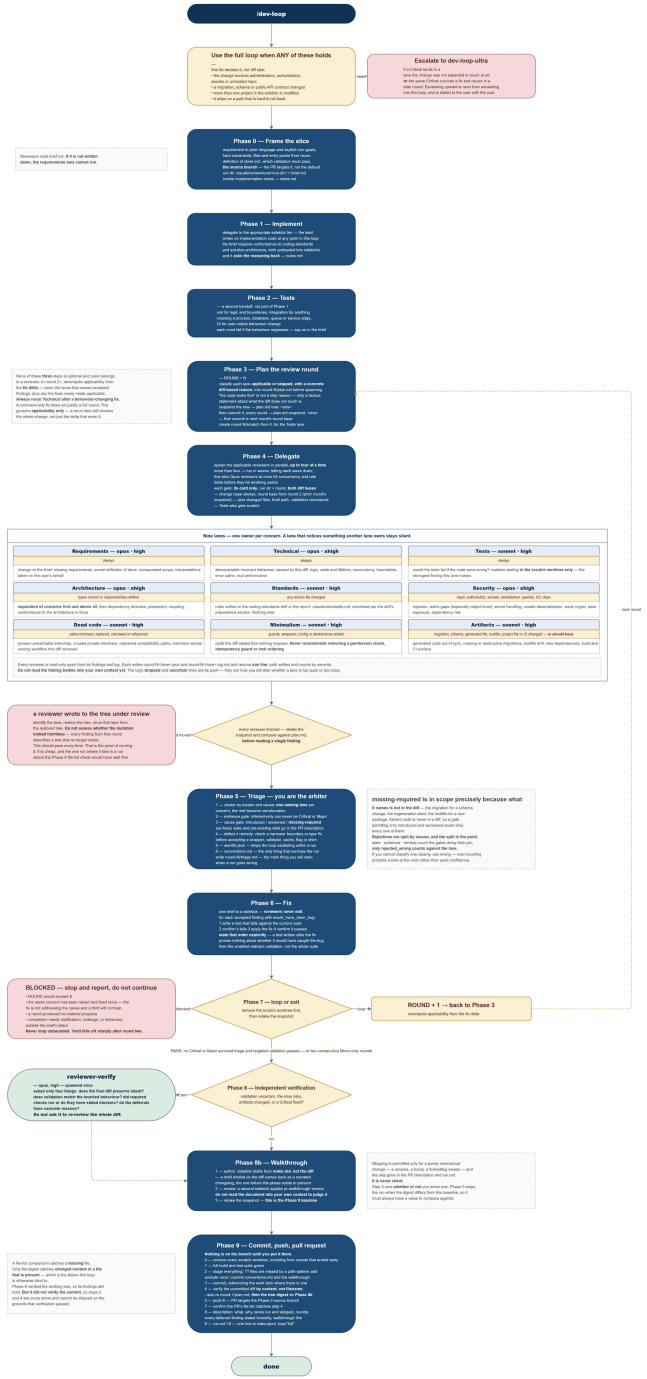

dev-loop-lite

Four consolidated lanes, two rounds, verification only when it is earned. Review cost ≈ 0.3× a full run. The lite loop economises on review, never on the code.

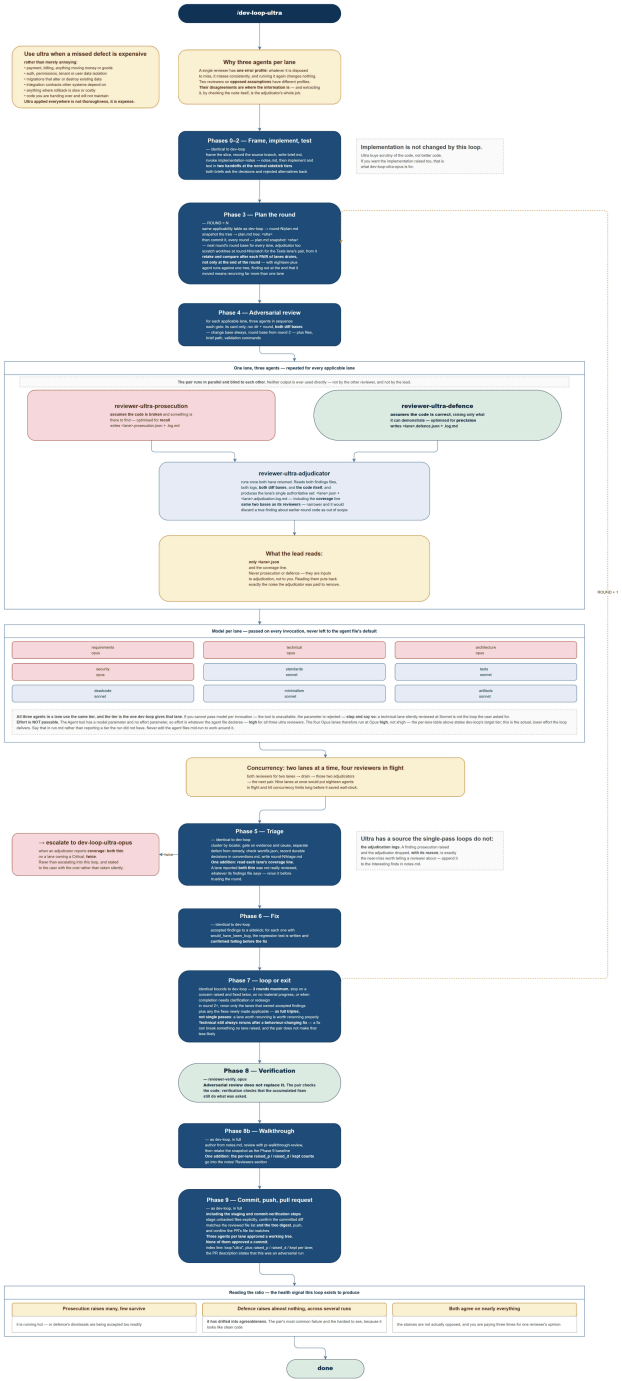

dev-loop — the full loop

Nine gated lanes, one owner per concern, three rounds. Four Opus lanes and five Sonnet. The honest default for most work — the 1× against which the other four loops are priced.

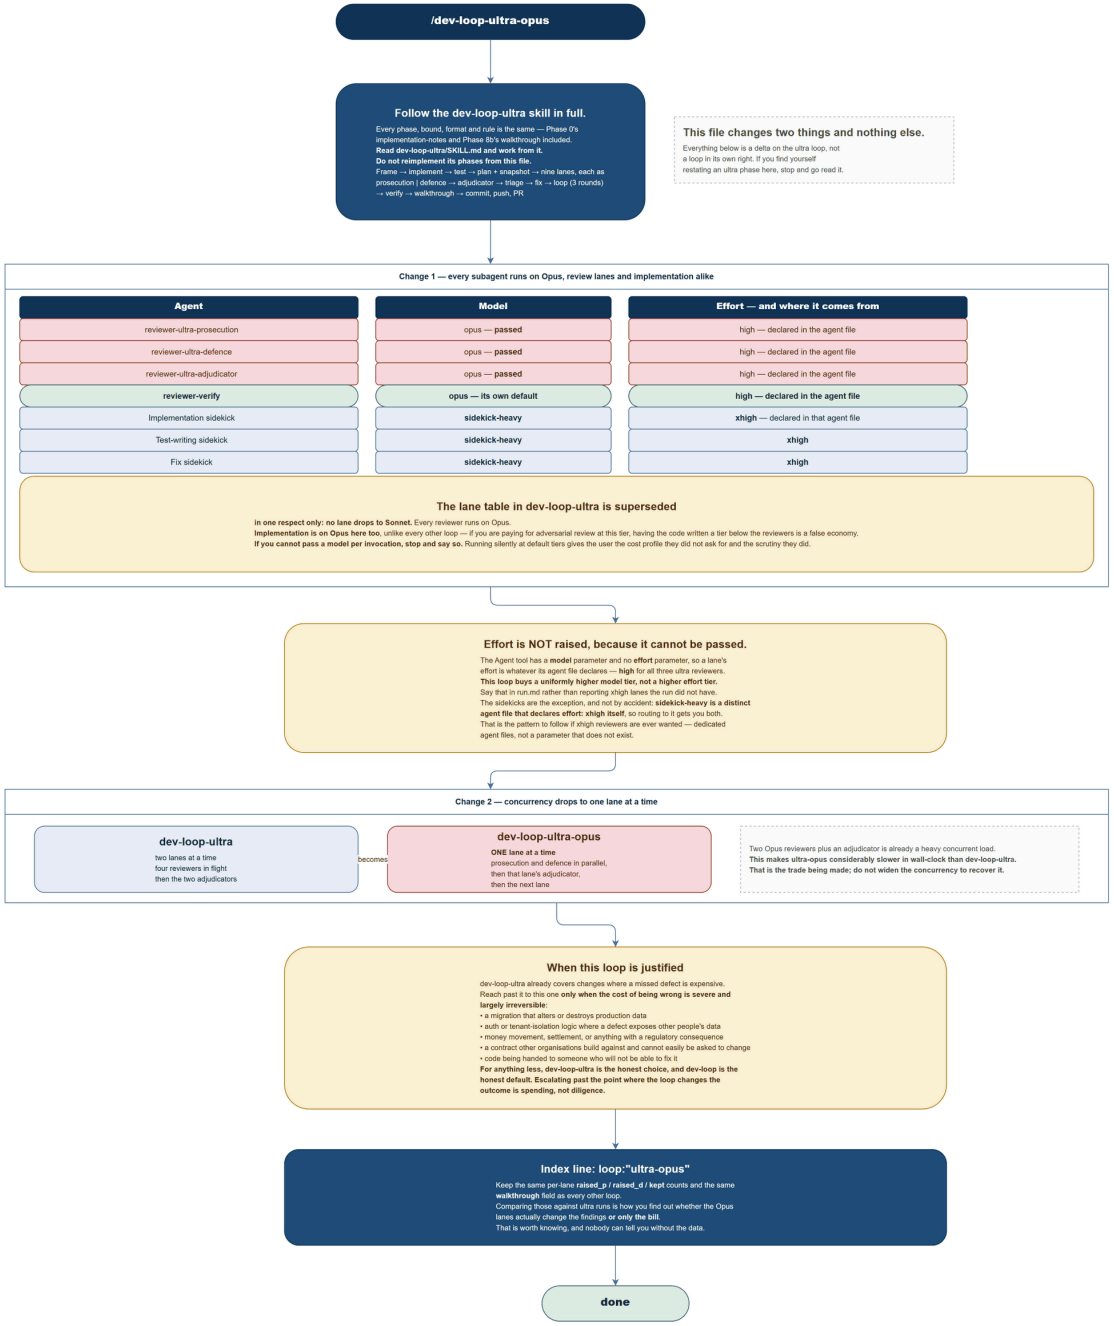

dev-loop-ultra — the adversarial loop

The same nine lanes as dev-loop, but each is reviewed twice on opposed assumptions and reconciled by a third agent. Roughly 3× the review cost. Implementation is unchanged — ultra buys scrutiny, not code.

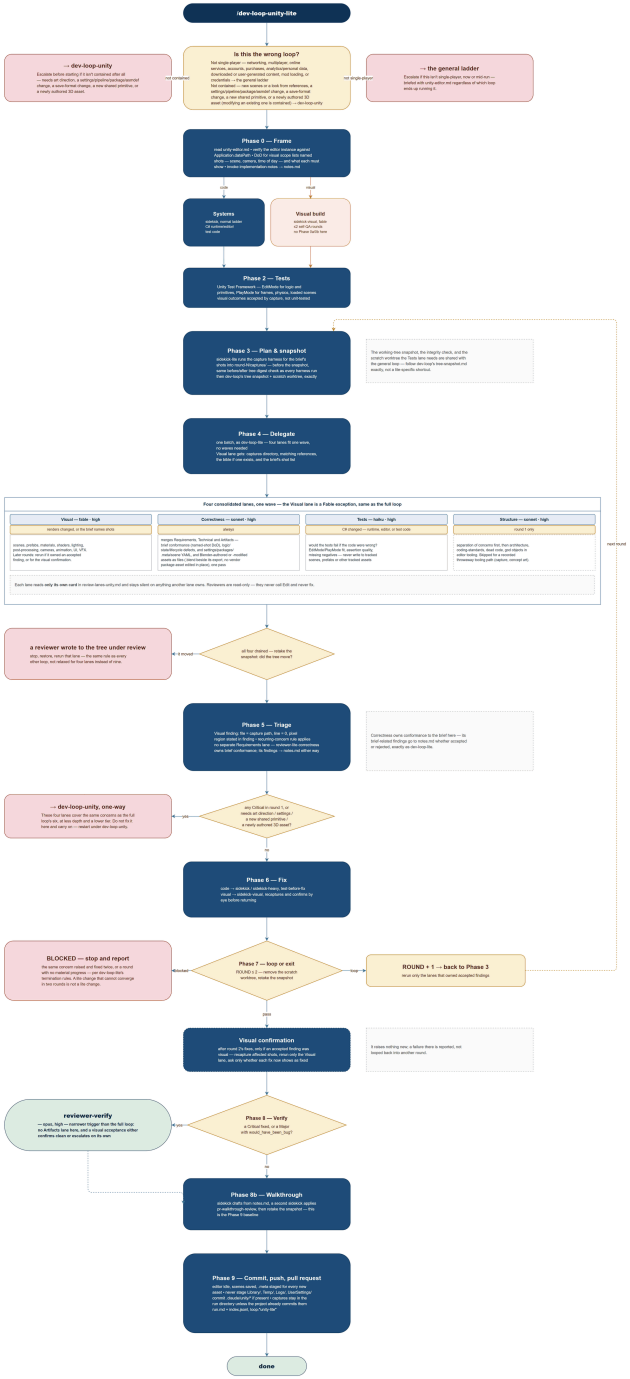

dev-loop-ultra-opus — adversarial, every subagent on Opus

Structurally identical to dev-loop-ultra. It changes exactly two things: the model on every agent, and the concurrency. Roughly 4× the review cost of a full run, and 2.7× the run as a whole — the most expensive loop available.

dev-loop-unity-lite

Four consolidated lanes plus a Fable Visual lane, two rounds, verification narrower than the full loop. Escalates to dev-loop-unity on a round-1 Critical or a scope break, to the general ladder if eligibility breaks.

dev-loop-unity

Six gated lanes across two waves, a Fable-driven Visual lane, Security dropped since an eligible change has no reachable surface. Two rounds plus a visual confirmation. No heavier Unity loop to escalate to.
